

# Drawing the shadows

*Eliciting expert knowledge to build a causal model of infection in children*

Dr Ariel Mace (PhD Candidate, UWA/TKI)  
ABNMS Conference, November 2022

About me...

---

# Aims

To discuss the:

- Why
- How
- What
- and “What the?”

of constructing an expert-elicited  
generic model of infection in children

# Why a causal model of infection?

Seaweed or Shark?

**JUST KEEP  
SWIMMING**

**Head for shore?**

# Fever in children

- Common
- Often non-specific
- Mostly self-limiting infections

However

- Consequences of missed serious infection may be significant

Eliciting a causal model of infection

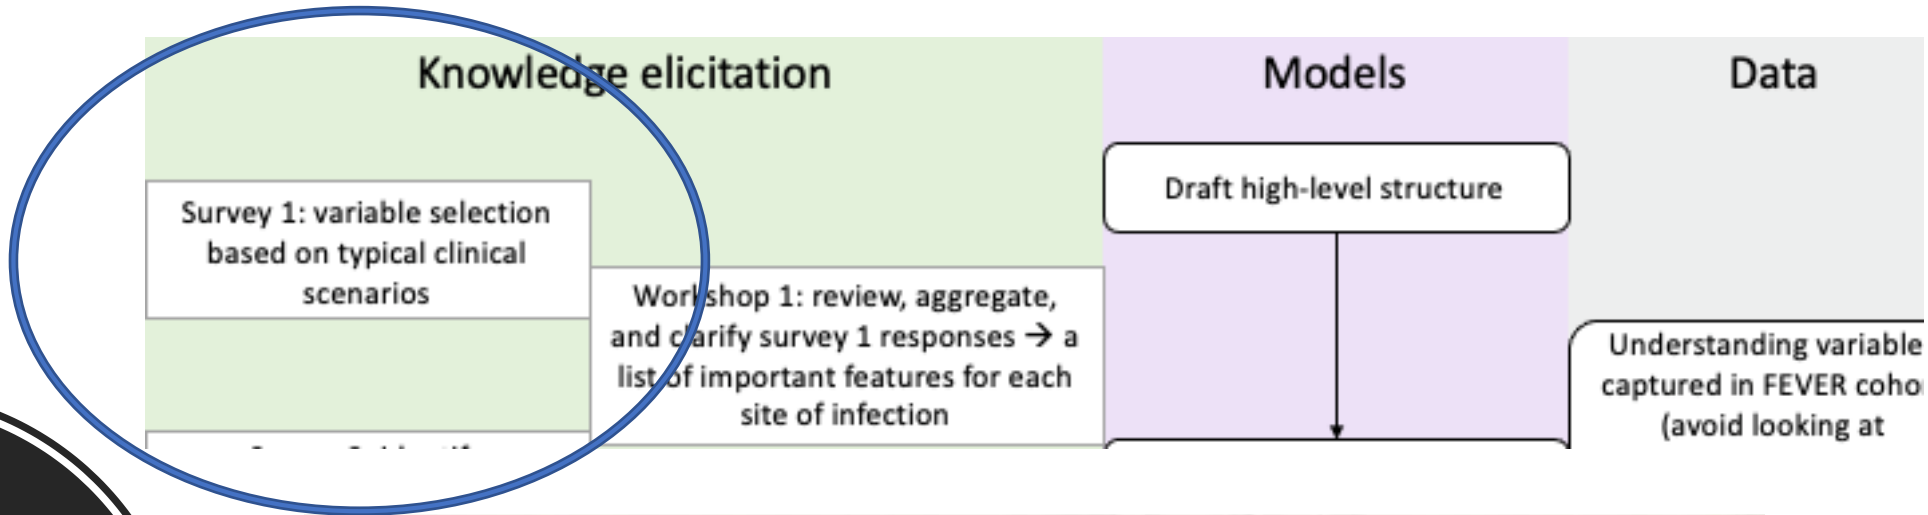

September 2020 –  
October 2021

- 4 workshops
- 21 experts - 6-10 experts/workshop
- Pre-workshop structured survey/written feedback

SCHN ethics approval to use >10,000 febrile children dataset

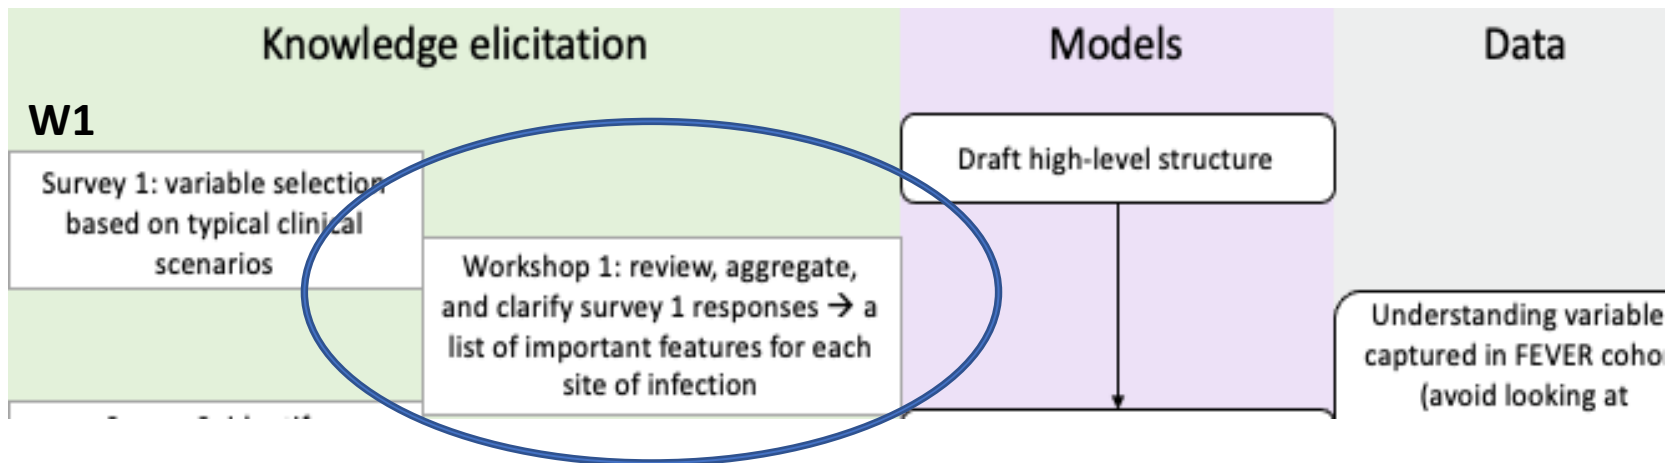

Workshop One – Describing the shadows

# Workshop One

- Survey results aggregated and presented back to experts
  - Elicited further signs and symptoms
  - Refined list
  - Removed redundancies
  - Clarified definitions, e.g. “unwell/toxic-appearing”, “feeding difficulties”

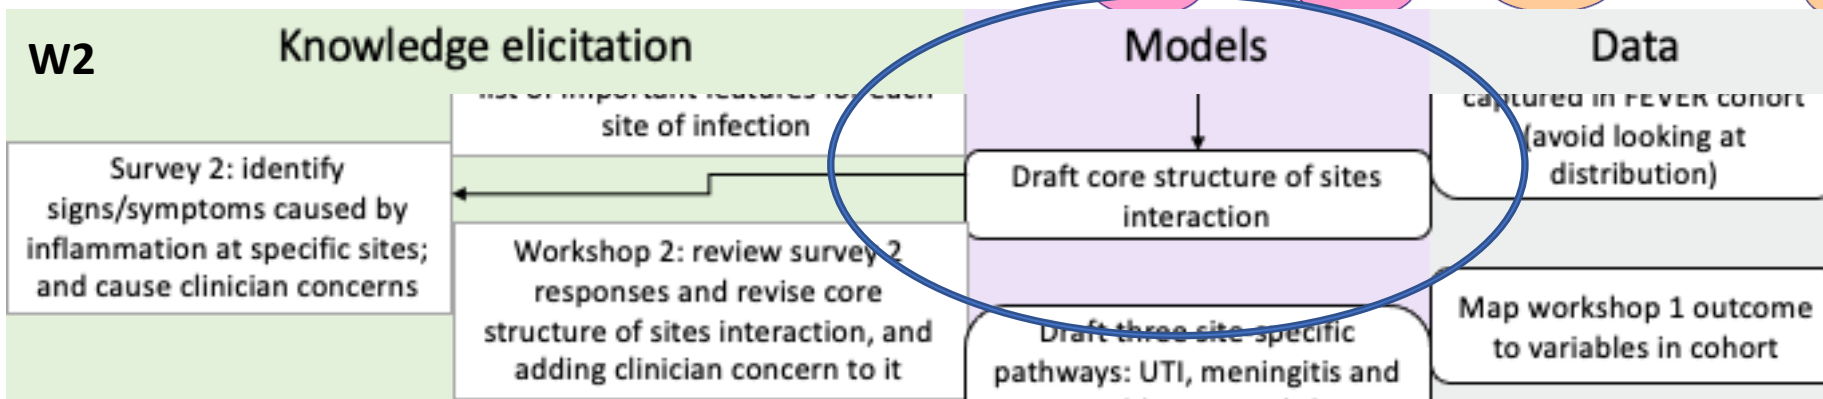

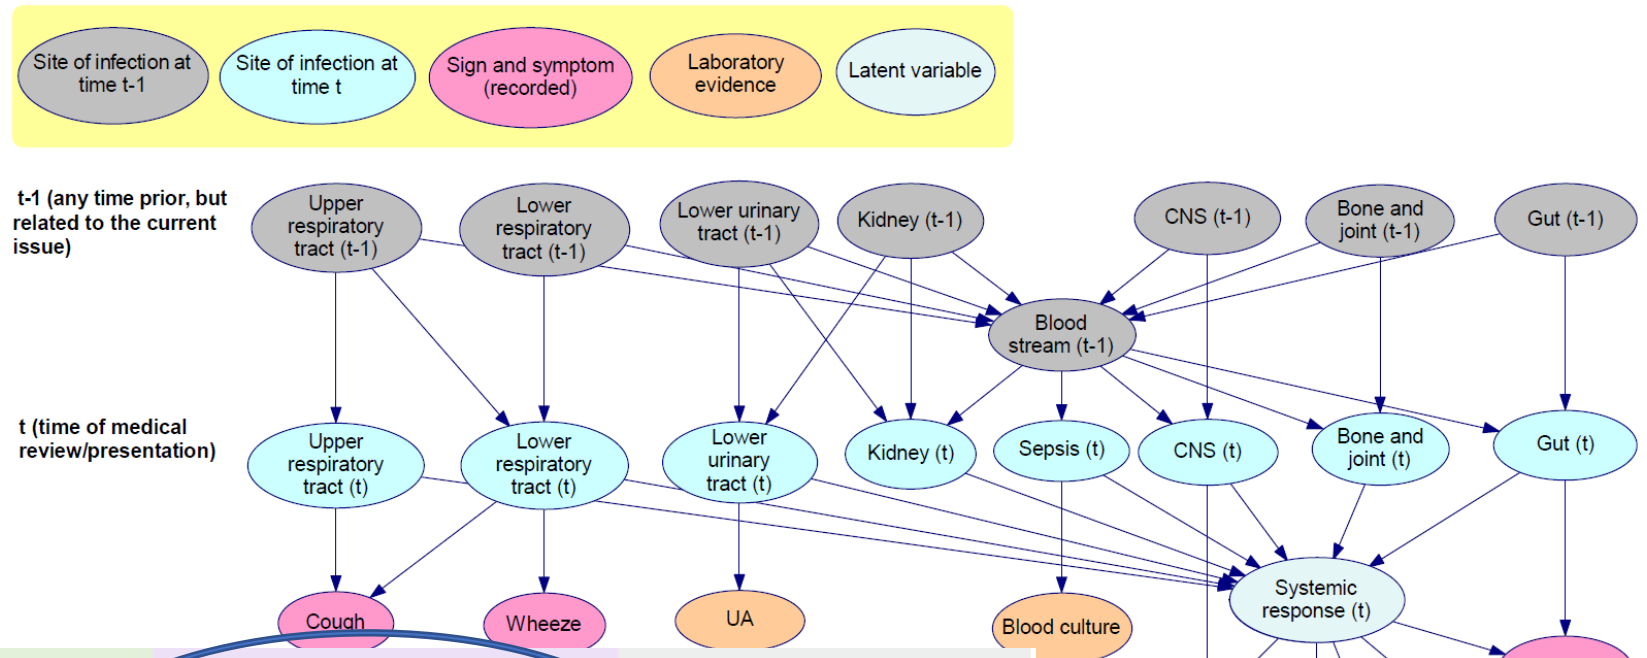

# Key learning points

- **Interrelated** nature of infection and progression
- Importance of **exclusion**
- **Numerous pathophysiological pathways** leading to similar signs and symptoms
- **Definitions** can differ between clinicians

# Workshop Two

What causes the shadows?

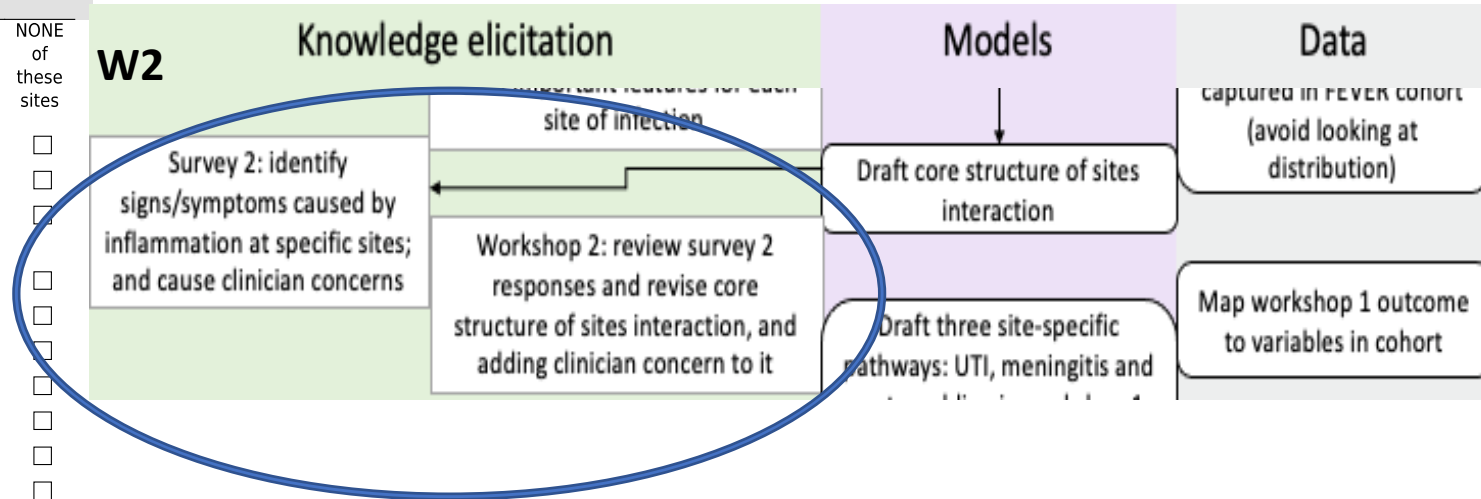

# Pre-Workshop Two

What causes the shadows?

For each of the signs/symptoms in the first column below, please identify all site/s at which **INFLAMMATION** at that site (local and/or systemic) could **DIRECTLY** give rise to that sign/symptom.

For example, in strep throat giving rise to rheumatic fever, inflammation of the throat may give rise **DIRECTLY** to sore throat, but inflammation of the throat **DOES NOT** directly cause impaired cardiac function (which is instead caused directly by inflammation of the heart valves).

	Upper resp tract	Lower resp tract	Upper Urin. tract	Lower Urin. tract	CNS	Bone/joint	GI tract	Skin	Systemic infl.	ALL of these sites	NONE of these sites

# Handy hints

Communicating causal models to clinicians

Flowchart: Discharge decision-making for infants < 3 months old admitted to hospital with fever without source

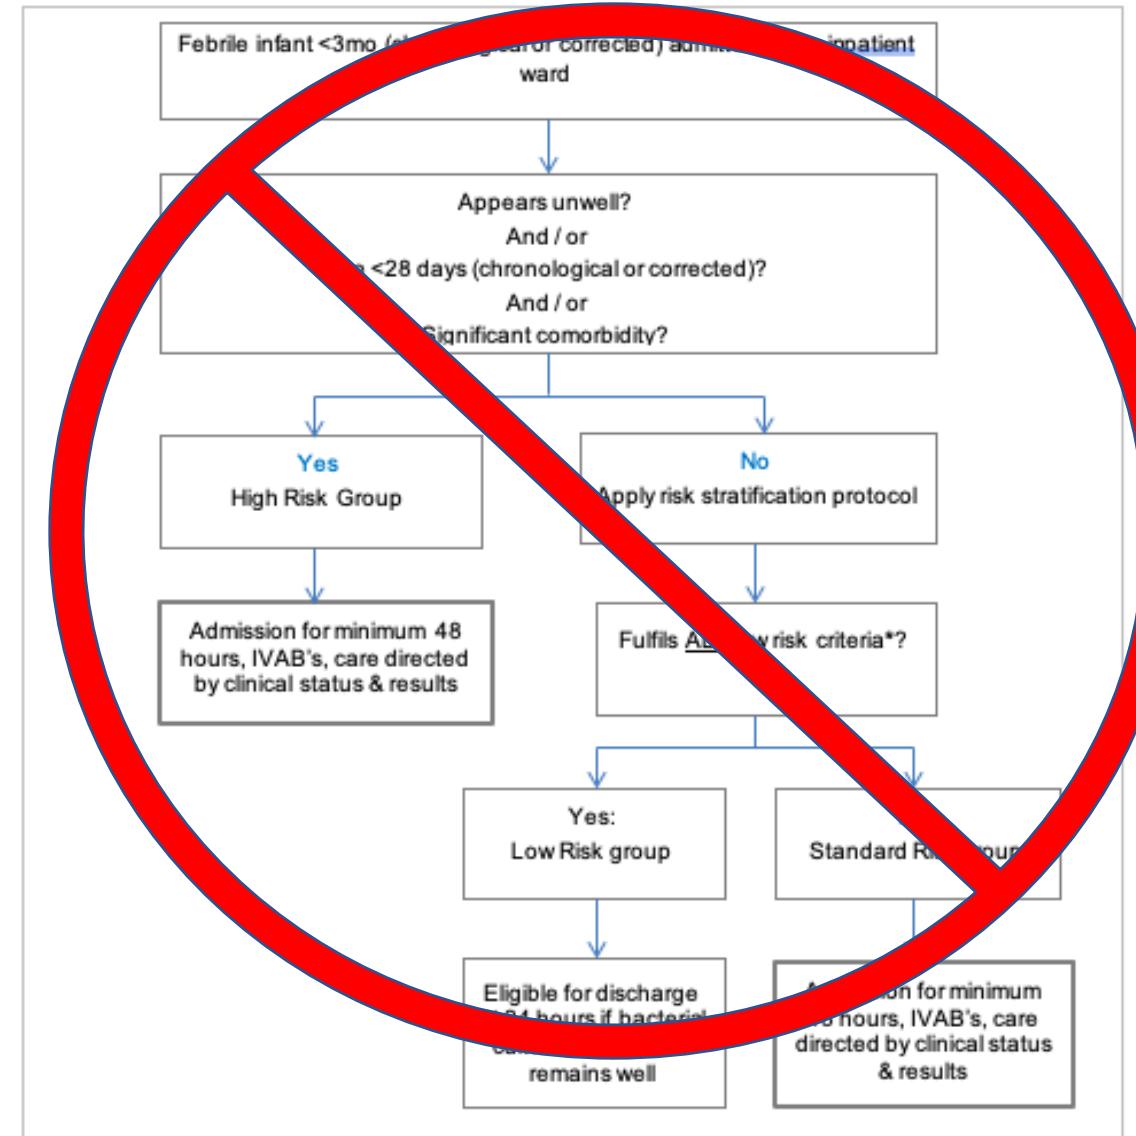

# Handy hints

Communicating causal models to clinicians

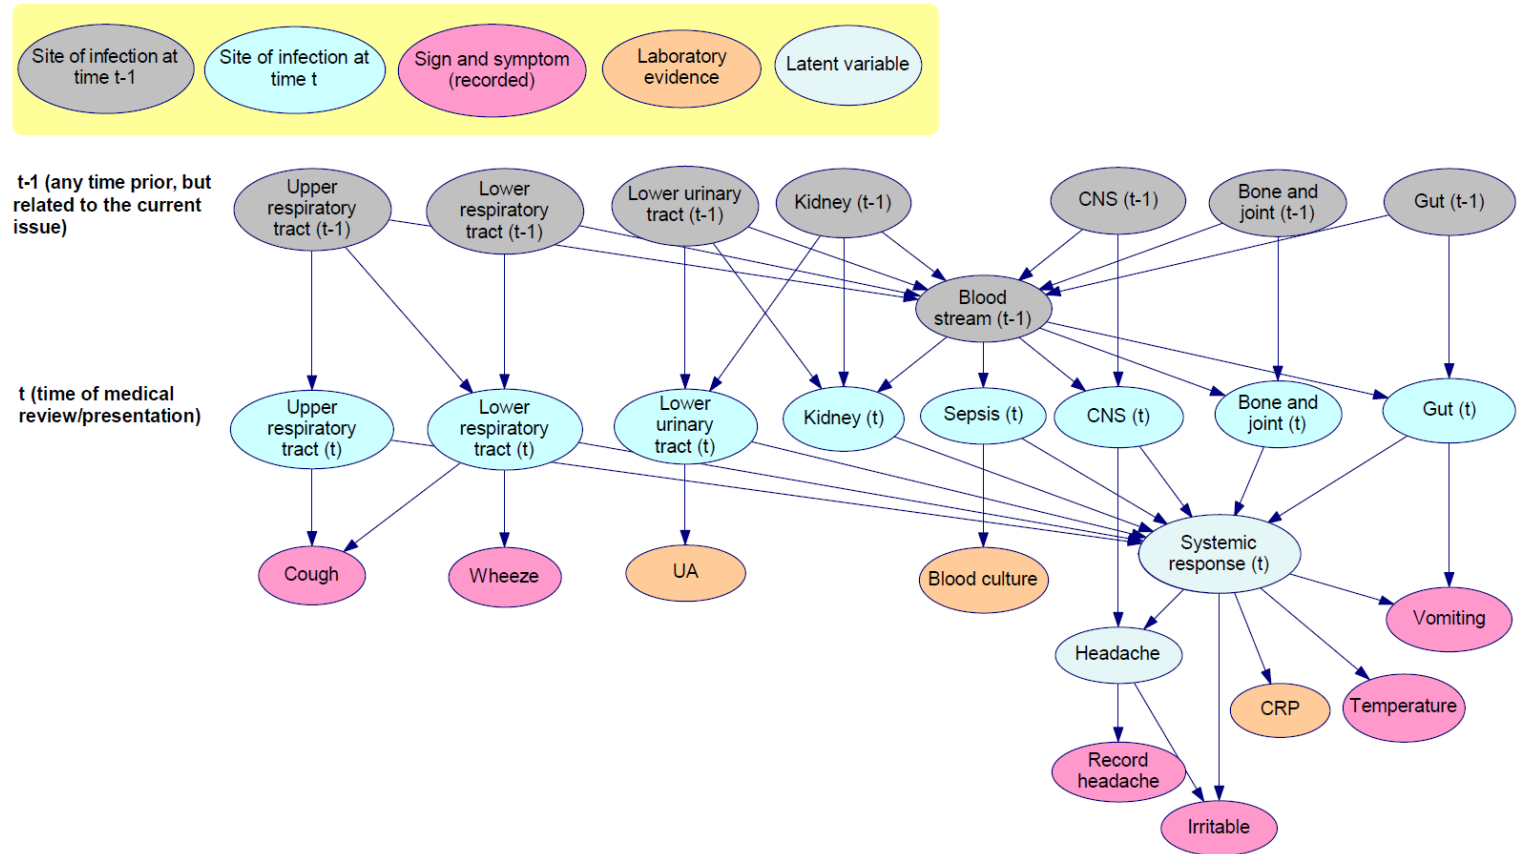

Flowchart: Discharge decision-making for infants < 3 months old admitted to hospital with fever without source

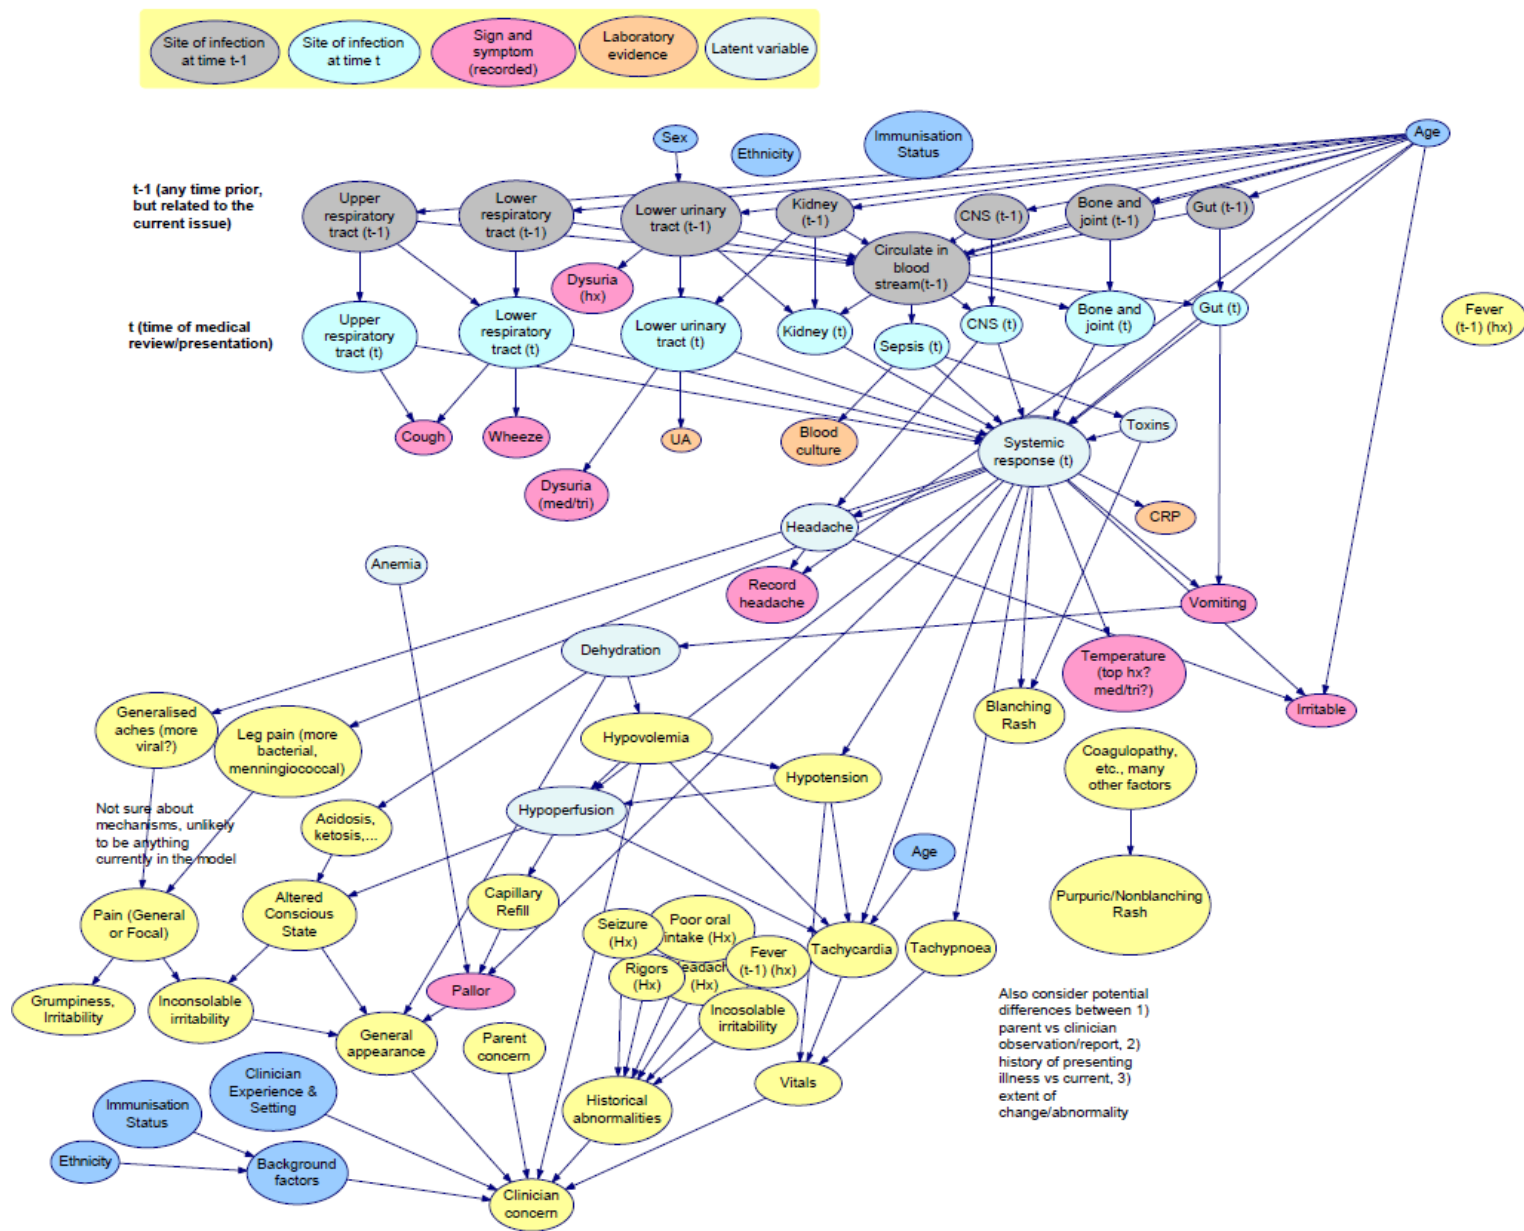

# Workshop Two

# Workshop Two

# A matter of time...

---

- Timing and source of observable information may vary
- Even single tests have time components
- One model may need to capture different stages of the illness

# Negatives can be a positive

- Negative findings are allowed and can still contribute to likelihoods
- Information can be absent – does not contribute to likelihoods

# Workshop 3 – connecting the shadows

Features elicited in Workshop One

+

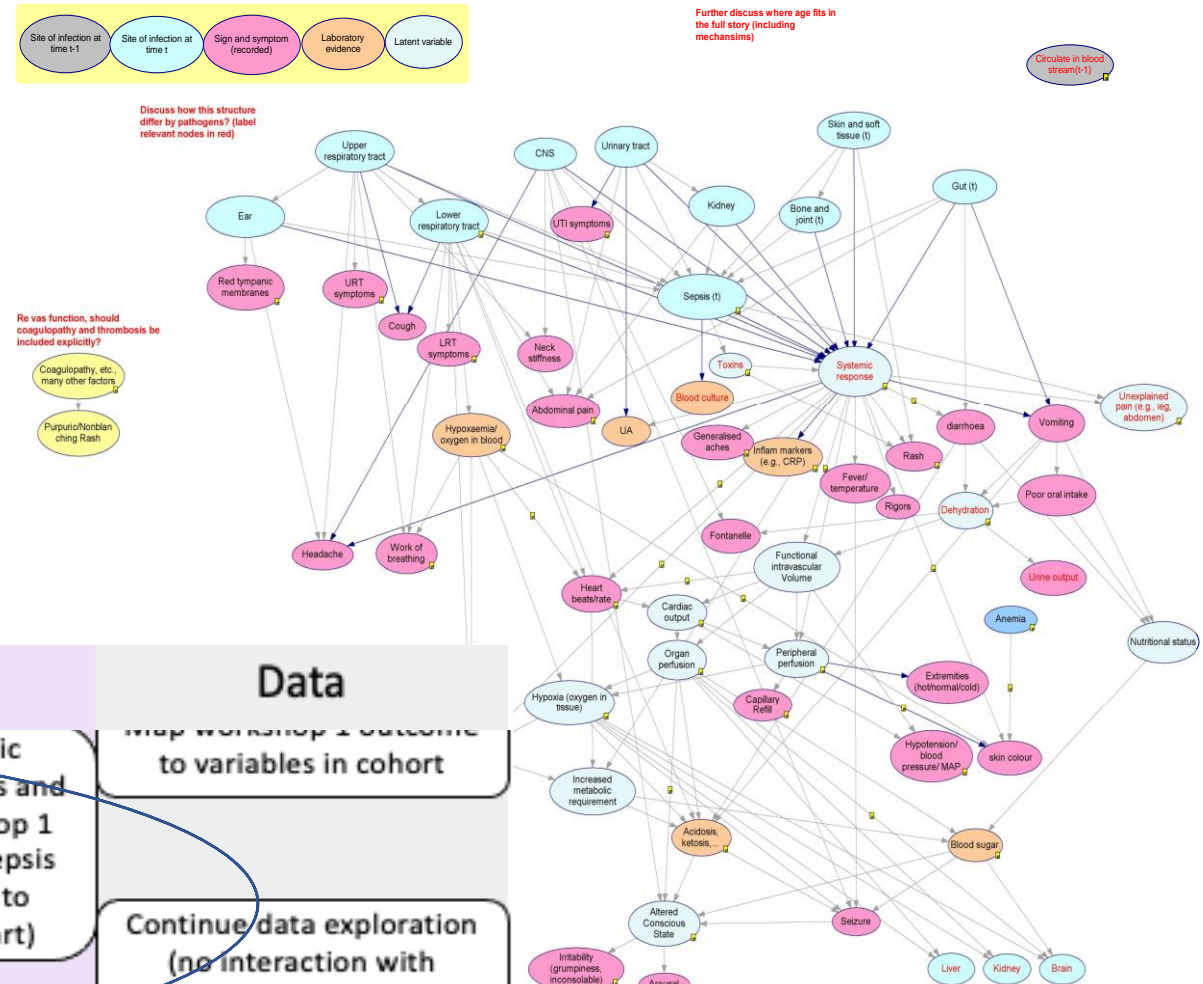

Knowledge of relationships from Workshop Two

=

Large comprehensive causal diagram

→

four draft models - 3 sites of infection and 1 sepsis-relevant pathophysiological pathways

W3

Knowledge elicitation

Models

Data

structure of sites interaction, and adding clinician concern to it

Draft three site-specific pathways: UTI, meningitis and gastro adding in workshop 1 survey outcomes, and sepsis mechanisms (mapped to Sepsis ESCALATION chart)

Map workshop 1 outcomes to variables in cohort

Survey 3: ask for feedback on site-specific pathways; provided summary of previous elicitation for newly joined experts

Workshop 3: revise UTI, meningitis and gastroenteritis pathways.

Continue data exploration (no interaction with elicitation)

Refined UTI, meningitis and

### Workshop1 survey outcome

#### Background

- History of urinary tract abnormality (shown, node u1)
- Previous UTI (shown, node u1)
- No sick contacts (parent node for other infection site, e.g. resp and gut infection, explaining away)

#### Symptoms

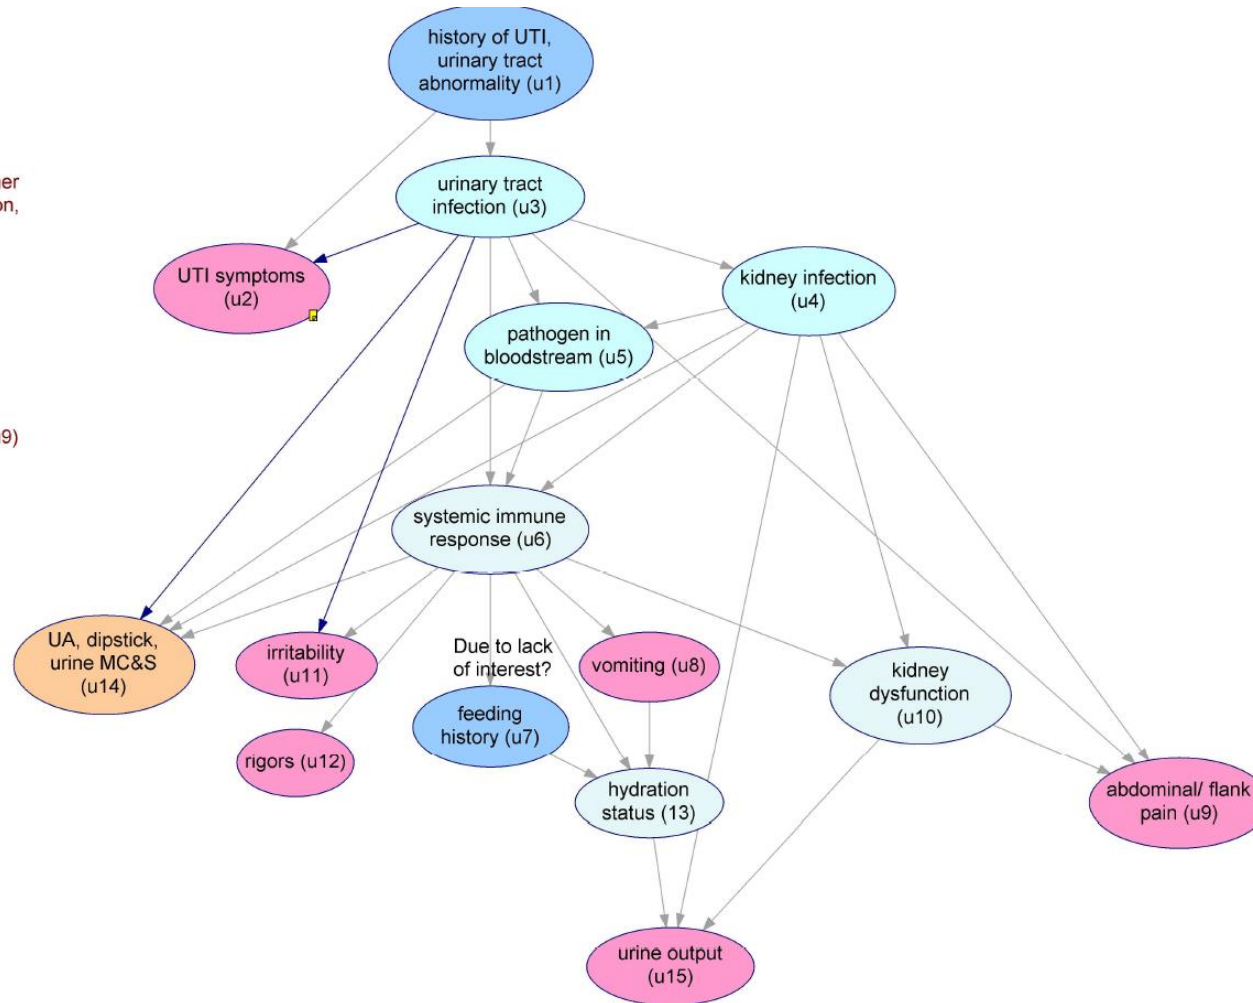

- Urinary frequency (shown as UTI symptom, node u2)
- Dysuria (as above, node u2)
- Offensive urine (as above, node u2)
- Feeding history (shown, node u7)
- Vomiting (shown, node u8)
- Abdominal/flank pain (shown, node u9)

#### Examination findings

- Irritability (shown, node u11)
- Rigors (shown, node u12)
- Hydration status (shown, node u13)
- Normal examination (clarify)
- Unwell (clarify)

#### Investigations (shown, node u14)

- Urinalysis result/dipstick
- Urine MC&S

Urinary tract infection

### Workshop 1 survey outcome

#### Background

- Fam history of same (g1)
- Background: ?travel history, ?other exposures (g2)

#### Symptoms

- Diarrhoea (g7)
- History of vomiting (g8)
- Nature of vomit (g8)
- Oral intake (g9)

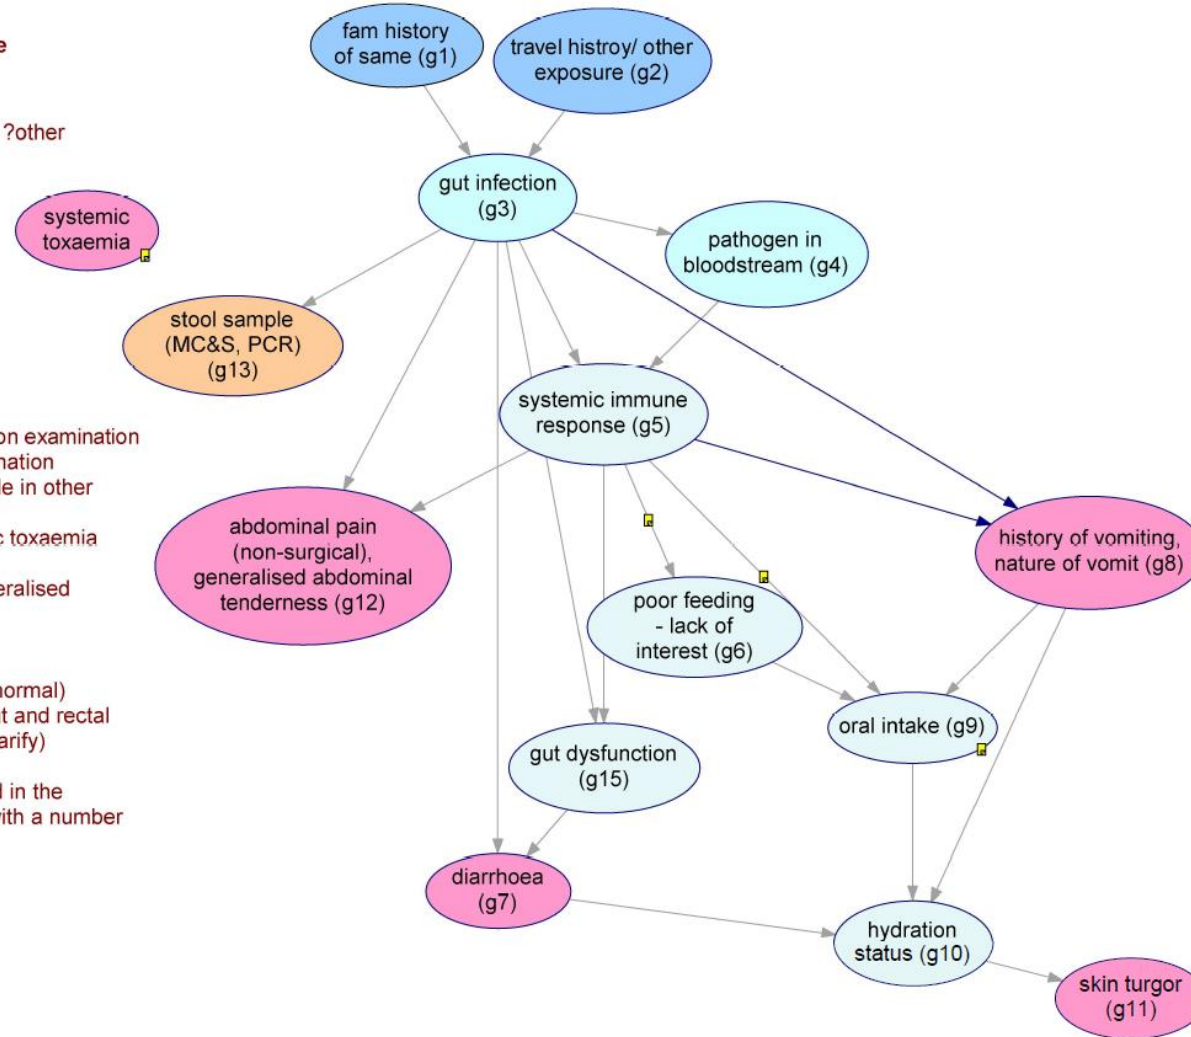

#### Examination findings

- Hydration status (g10)
- Skin turgor (g11)
- Absence of localizing signs on examination e.g. normal respiratory examination (explaining way, should include in other pathway/s)
- Absence of serious systemic toxaemia (clarify this)
- Non-surgical abdomen, generalised abdominal tenderness (g12)

#### Investigations

- Urine MC&S (?presumably normal)
- Pos PCR/Ag on stool (Throat and rectal swab) (g13, need to further clarify)

Items that have been included in the diagram have been labelled with a number (e.g. g1).

### Workshop1 survey outcome

#### Background:

- shunts (shown, node m1)
- hx of neurosurgery (shown, node m2)

#### Symptoms

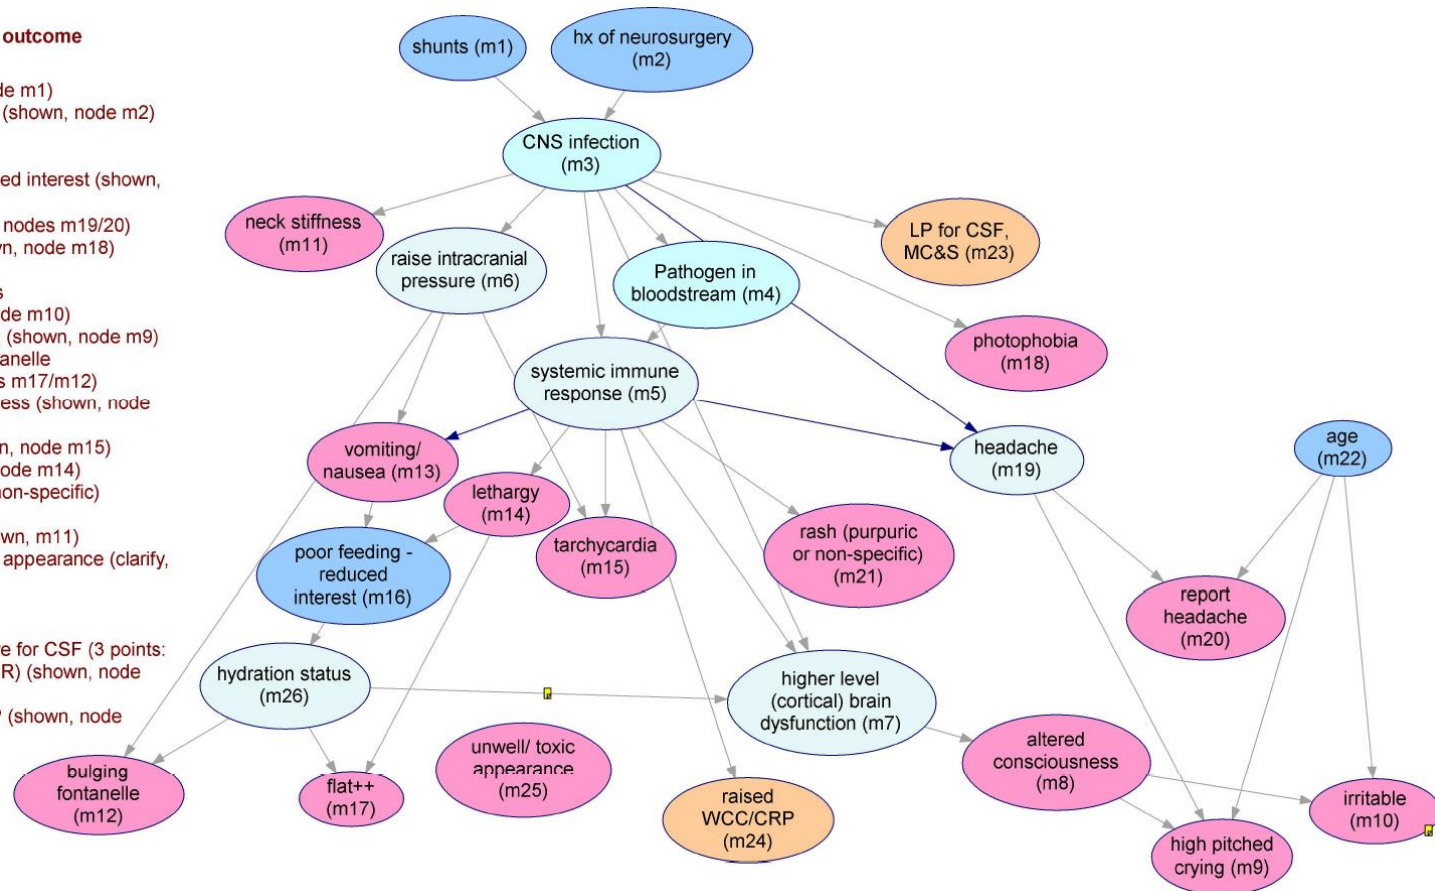

- Poor feeding/reduced interest (shown, node m16)
- Headache (shown, nodes m19/20)
- Photophobia (shown, node m18)

#### Examination findings

- Irritable (shown, node m10)
- High pitched crying (shown, node m9)
- Flat++/Bulging fontanelle (shown/clarify, nodes m17/m12)
- Altered consciousness (shown, node m8)
- Tachycardia (shown, node m15)
- Lethargy (shown, node m14)
- Rash (purpuric or non-specific) (shown, node m21)
- Neck stiffness (shown, m11)
- Looks unwell, toxic appearance (clarify, node m25)

#### Investigations

- LP, lumbar puncture for CSF (3 points: ED, Lab, Culture/PCR) (shown, node m23)
- Raised WCC/ CRP (shown, node m24)

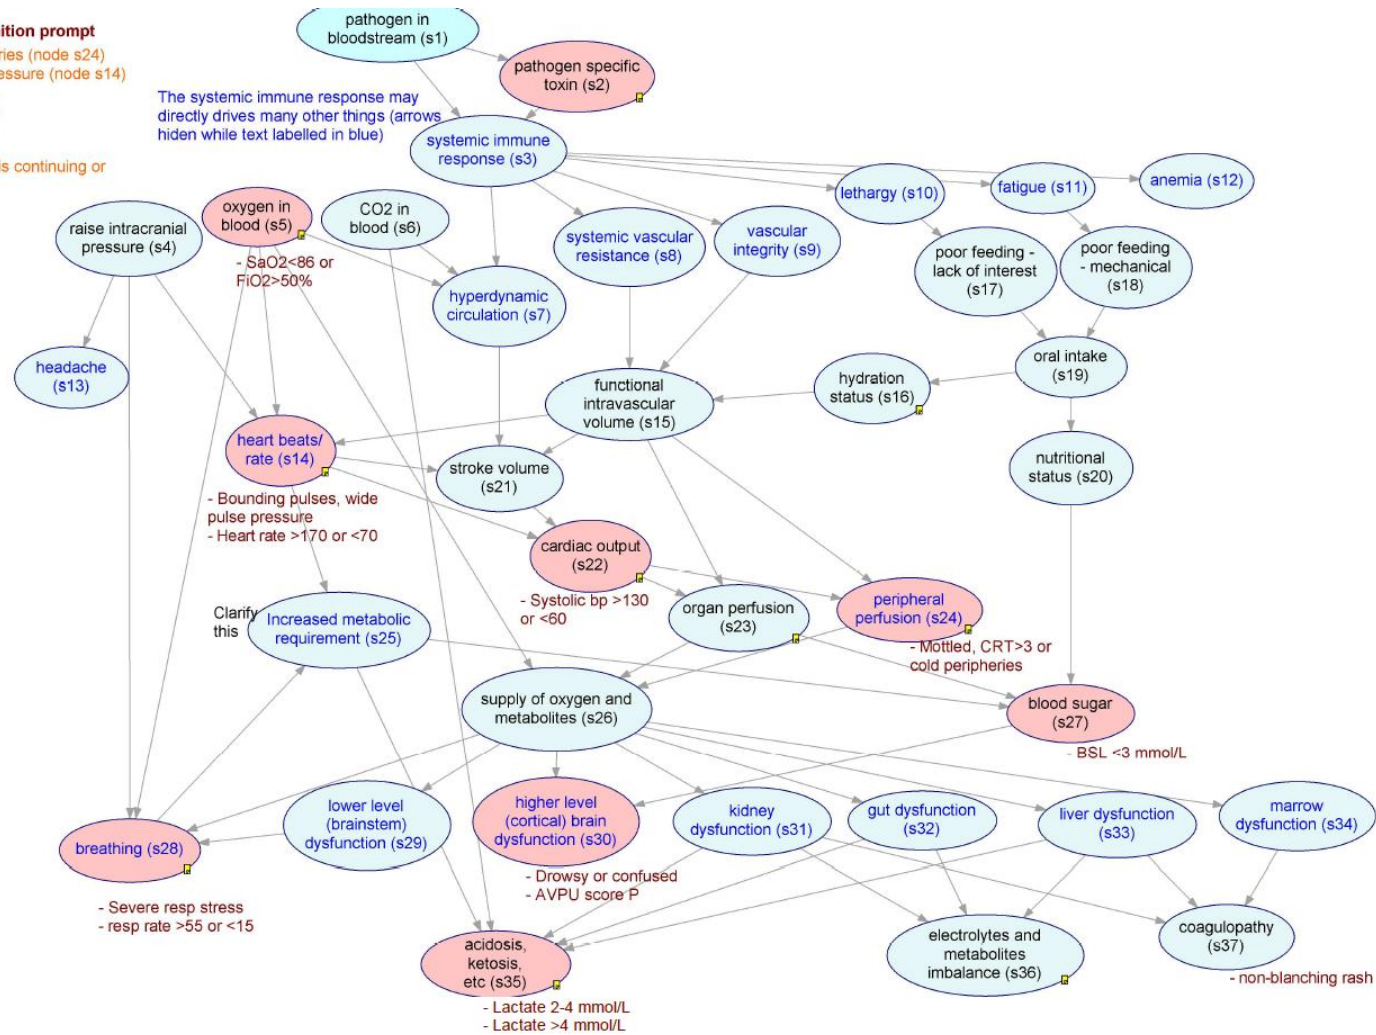

**Map to PARROT sepsis recognition prompt**

- Mottled, CRT>3 or cold peripheries (node s24)
- Bounding pulses, wide pulse pressure (node s14)
- non-blanching rash (node s37)
- Drowsy or confused (node s30)
- Unexplained pain (to discuss)
- Lactate 2-4 mmol/L (node s35)
- Family and/or clinician concern is continuing or increasing (to discuss)

- Any observation in red zone
- Severe resp stress (s28)
  - resp rate >55 or <15 (s28)
  - SaO2<86 or FiO2>50% (s5)
  - Heart rate >170 or <70 (s14)
  - Systolic bp >130 or <60 (s22)
- Others
- AVPU score P (s30)
  - Lactate >4 mmol/L (s35)
  - BSL <3 mmol/L (s27)

**Key discussion points**

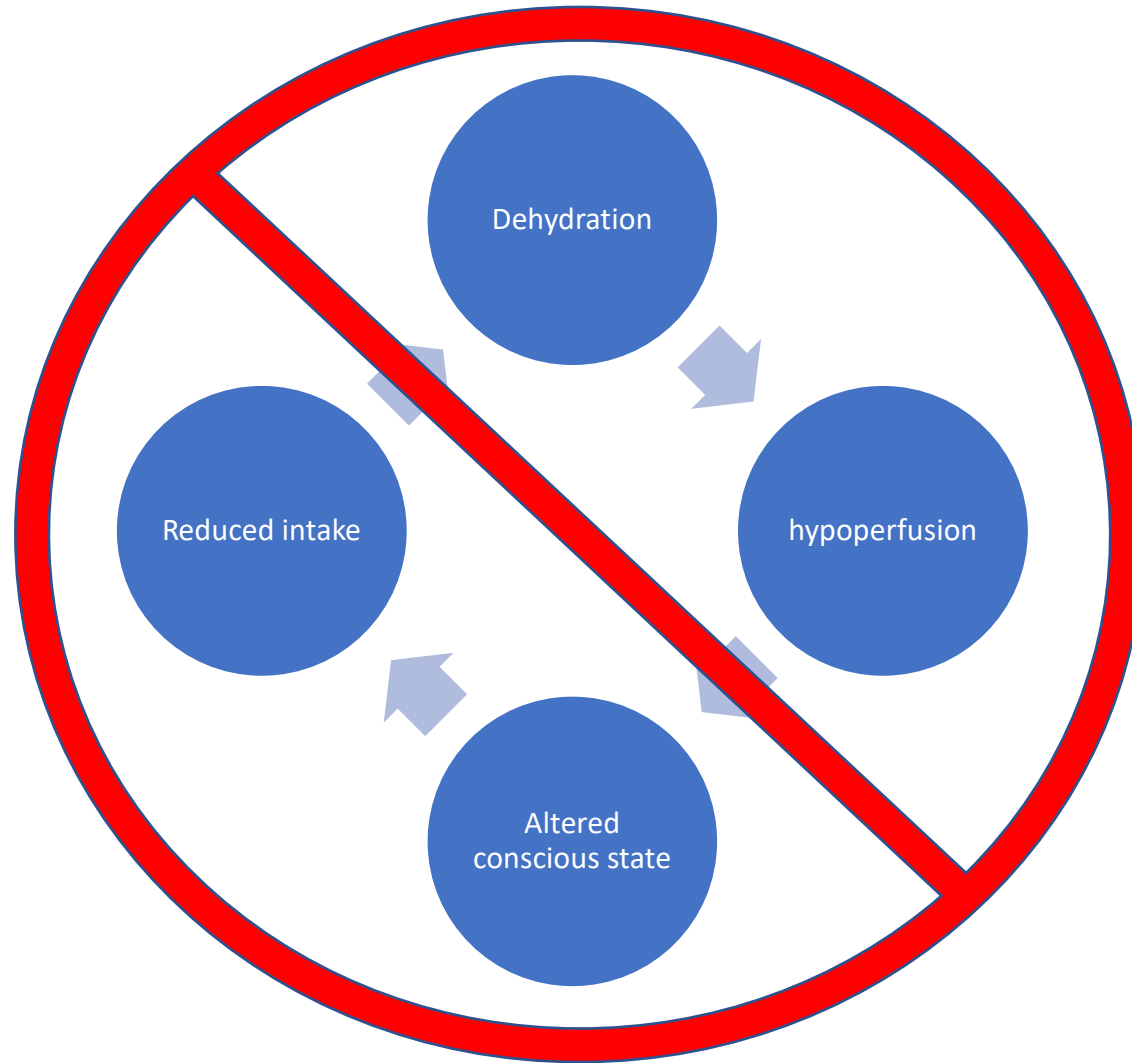

- Unexplained pain
- Family and/or clinician concern is continuing or increasing

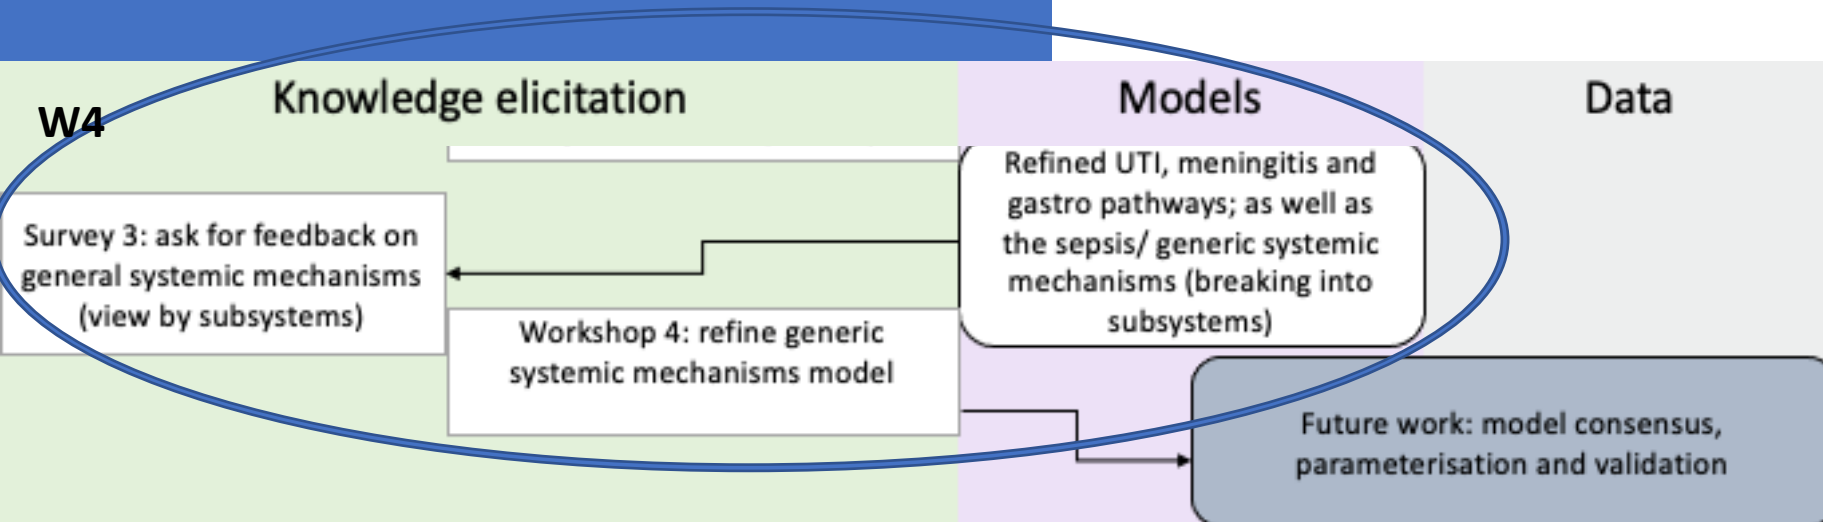

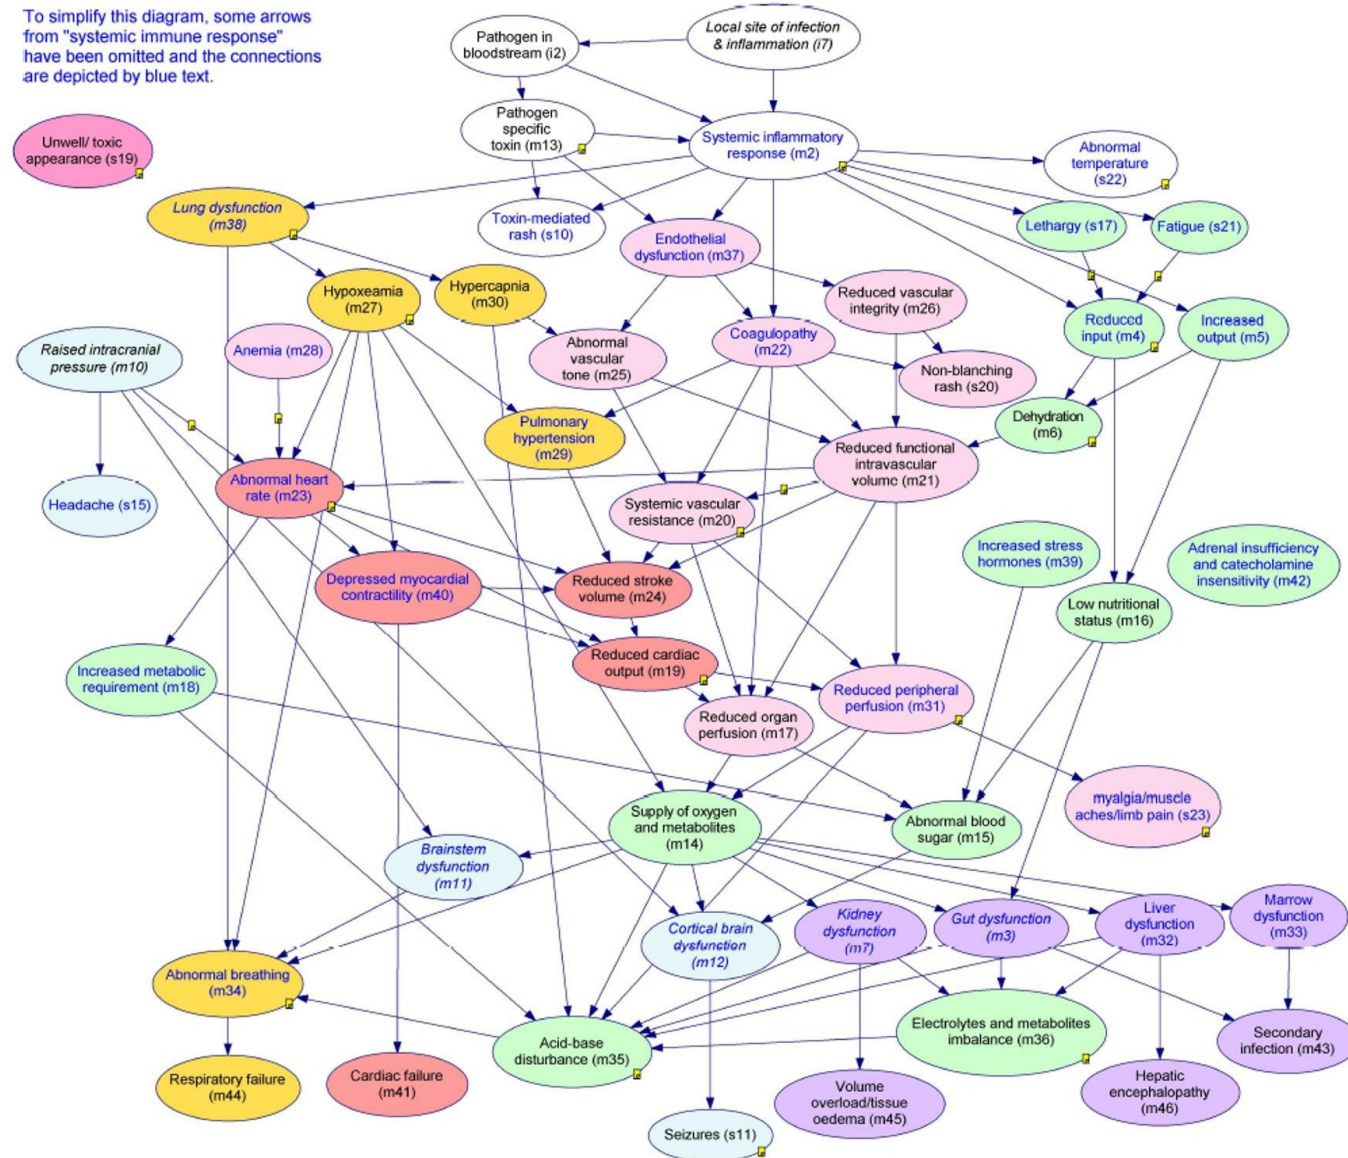

# Feedback loops

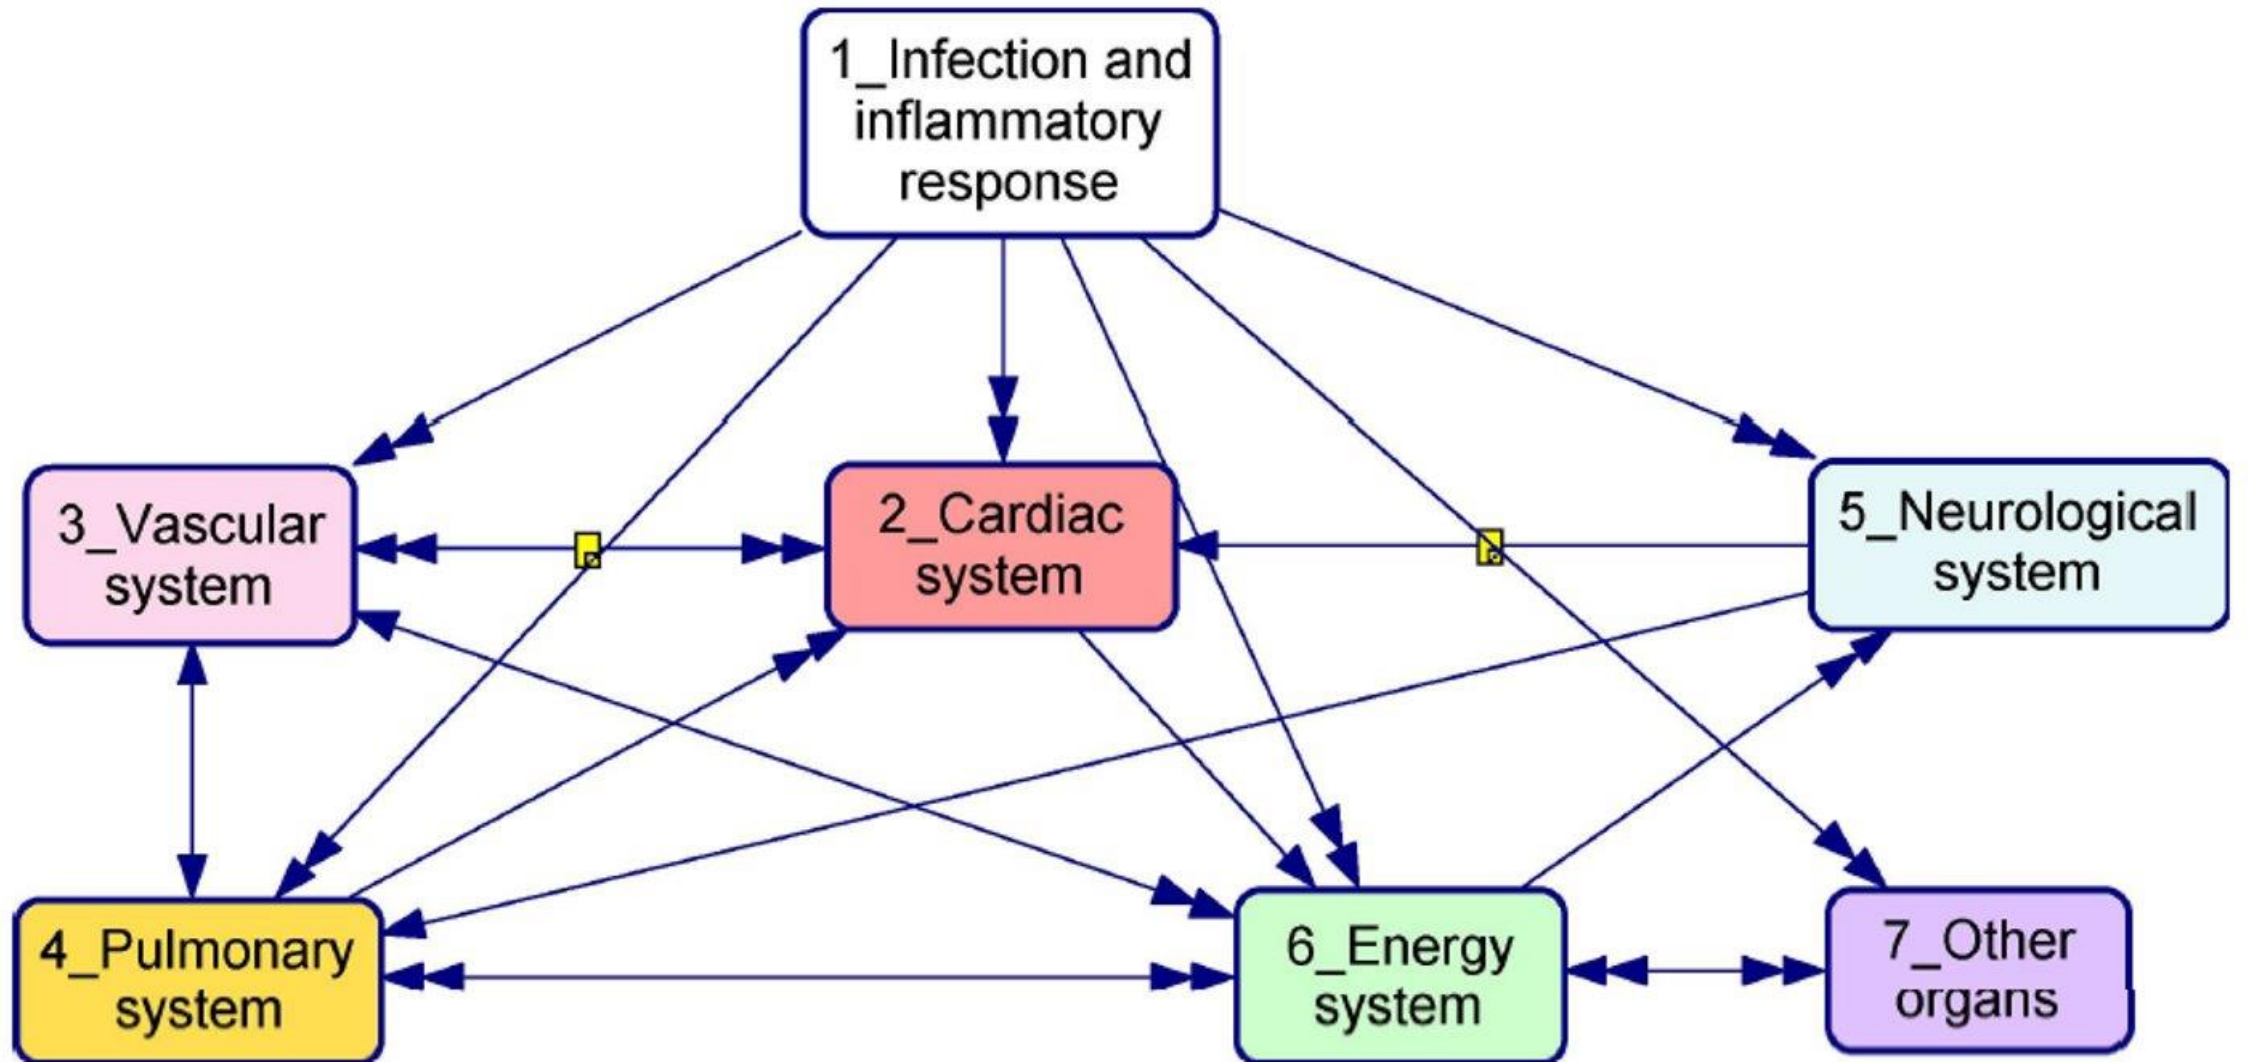

# Workshop Four – drawing the (sepsis) shadow

To simplify this diagram, some arrows from "systemic immune response" have been omitted and the connections are depicted by blue text.

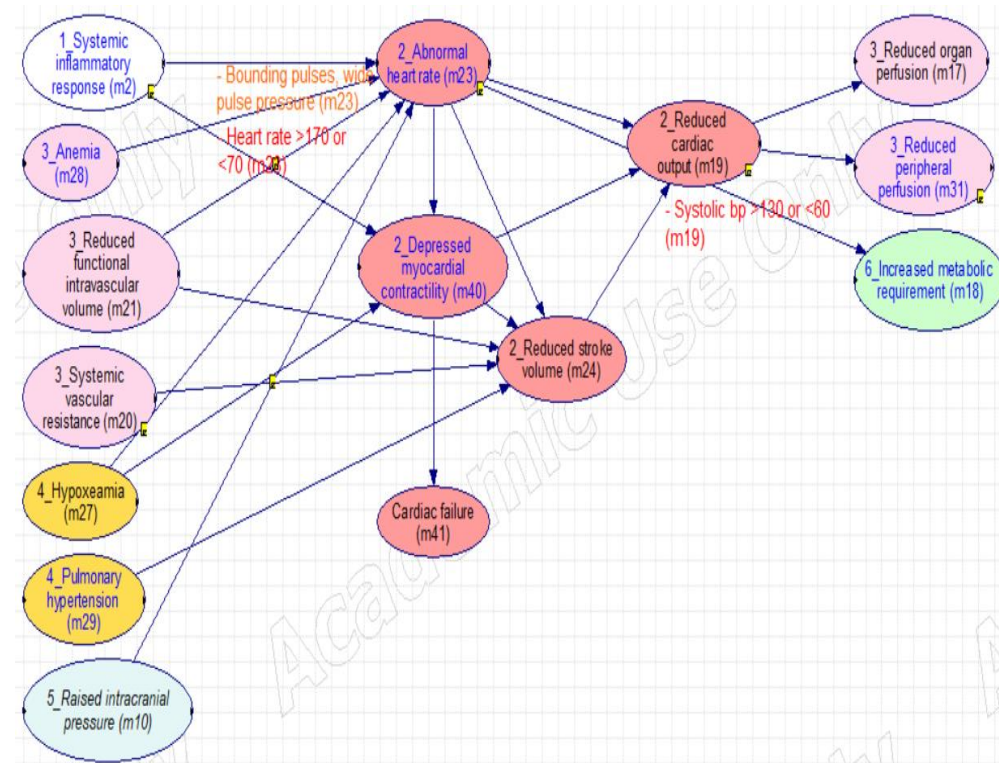

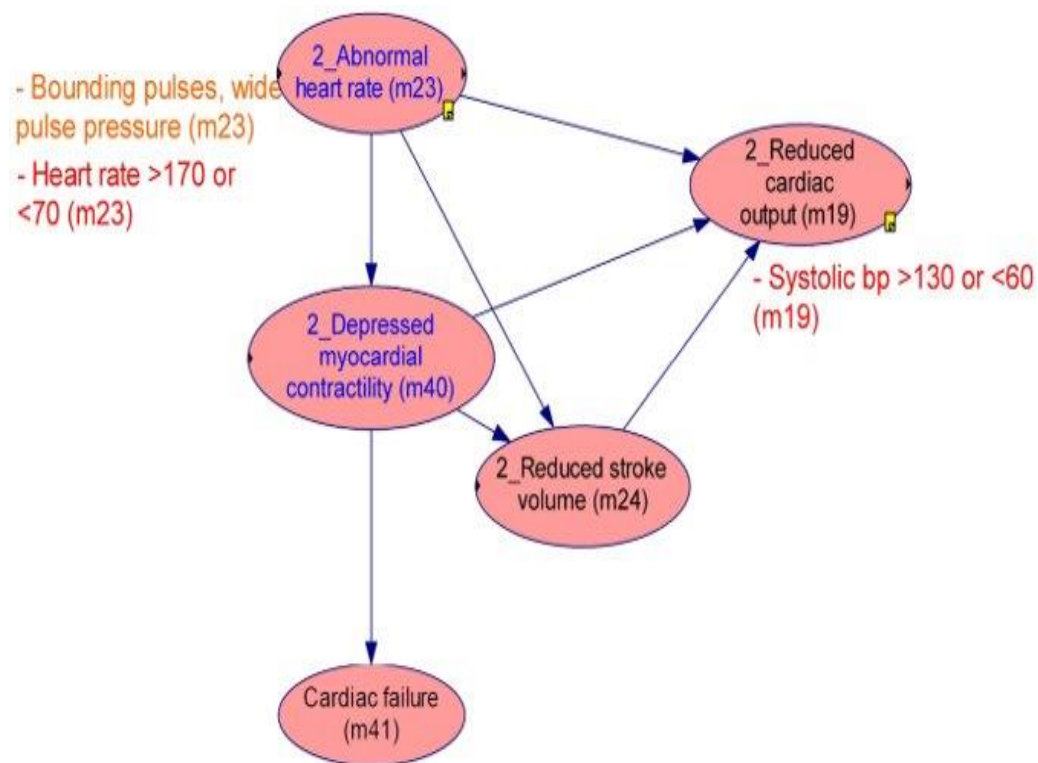

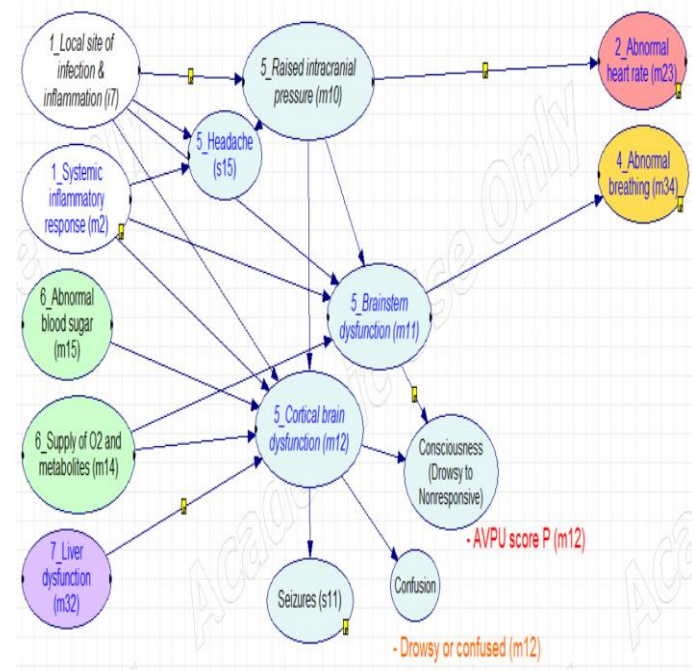

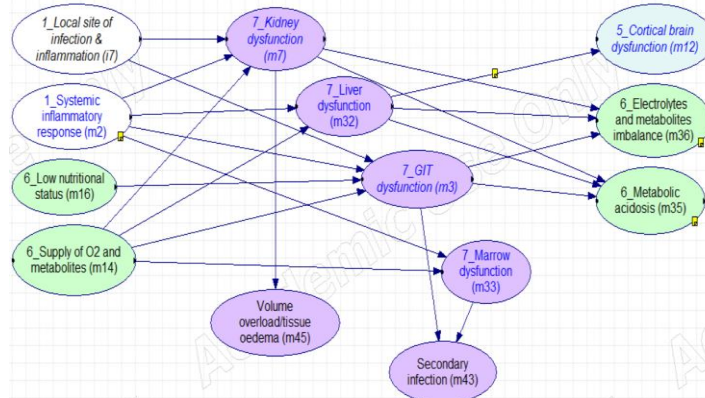

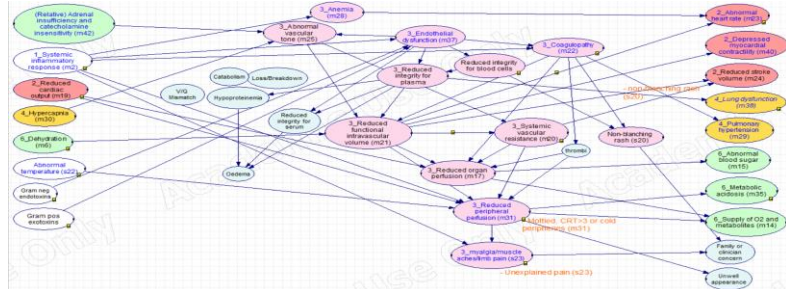

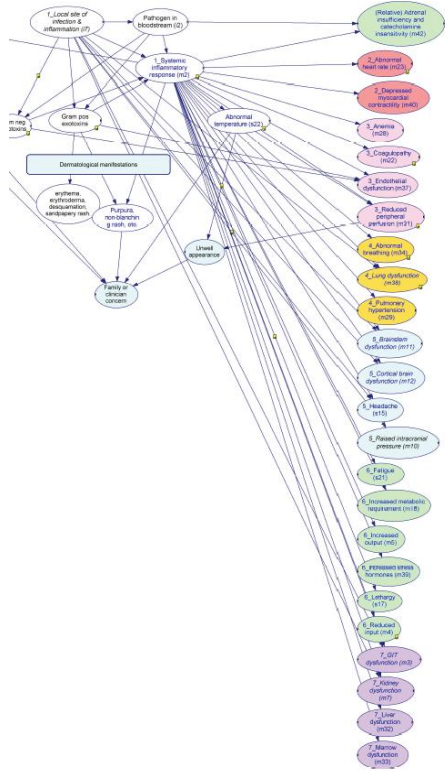

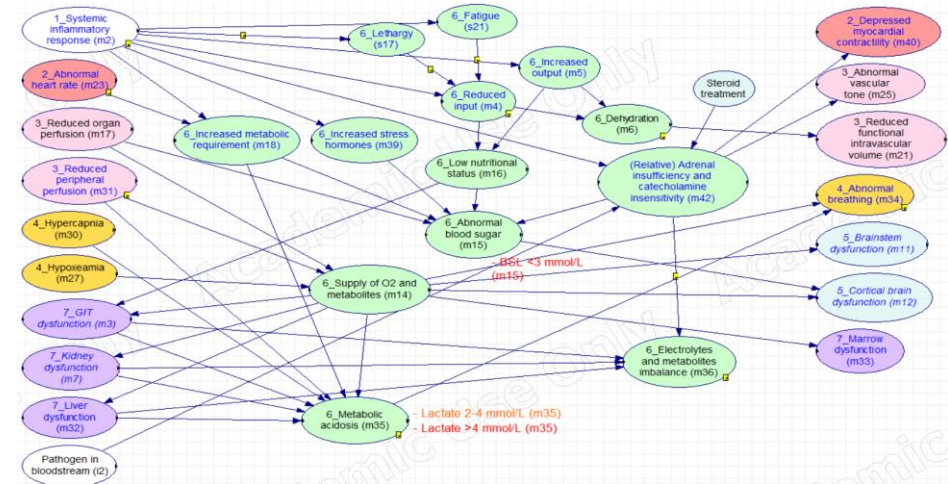

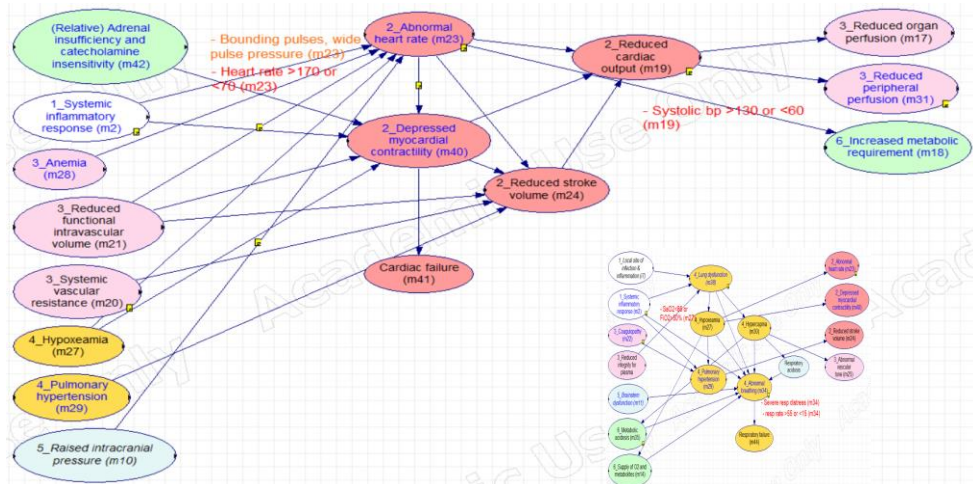

# Systemic mechanisms – cardiac

Nodes are highlighted by blue text if they can be directly affected by systemic inflammatory response.

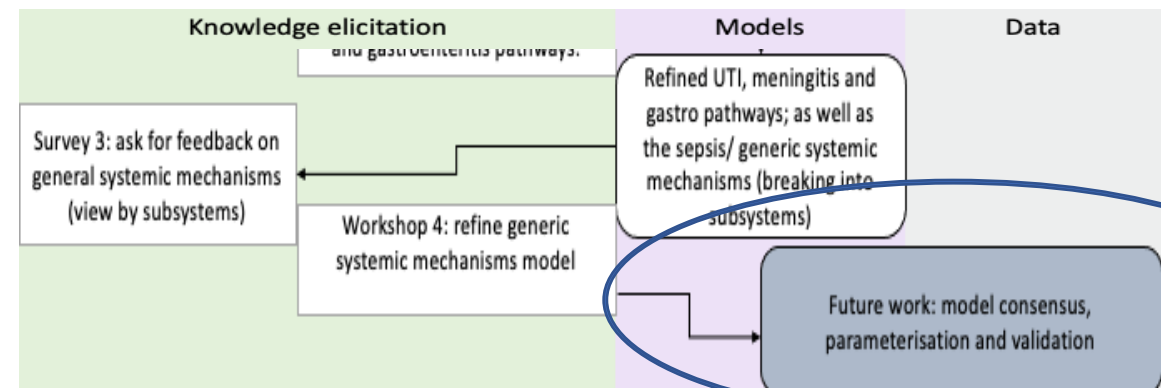

The cardiac and vascular systems closely interact. While **vascular resistance** and **functional intravascular volume** predominately drive the amount of blood available to supply organs, the heart creates the forward movement of blood needed to maintain supply to organs (**organ perfusion**). This is measured as stroke volume (the volume of blood ejected for each stroke) and **cardiac output (m19)** - the product of **heart rate (m23)** and **stroke volume (m24)**. Note that, cardiac output is actually normal or high until the very late stages of sepsis.
