

# ARE BIBLIOMETRIC CHARACTERISTICS GOOD PREDICTORS OF A PAPER'S CITATION SCORE?

AN APPLICATION OF LEARNING AND VALIDATING CONTINUOUS BNS FOR HIGHLY SKEWED DISTRIBUTIONS

---

*Tina Nane & Anca Hanea*

## Centre for Science and Technology Studies

The Centre for Science and Technology Studies (CWTS) studies scientific research and its connections to technology, innovation, and society. Our research, bibliometric and scientometric tools, and evaluation expertise provide a solid basis for supporting research assessment and strategic decision making and for developing science policy.

## Collaborative Assessment for Trustworthy Science

the replicATS project

**The replicATS project aim is to crowdsource evaluations of the credibility of published research in eight social science fields: business research, criminology, economics, education, political science, psychology, public administration, and sociology.**

In phase 2, the replicATS project is about reimagining peer review as a structured deliberation process.

Predict mean citation score (*mcs*) of a paper / the average number of citations since publication  
(~ future scientific achievement)

“how often a paper is cited should be predicted by the quality and reliability of the science”

“there is no evidence that citations reflect other key dimensions of research quality”

“[...] large enough data sets reveal that there are parameters independent of individual papers' quality that can determine an average citation rate.”

“[...] large enough data sets reveal that there are parameters independent of individual papers' quality that can determine an average citation rate.”

Predict *mcs* - papers published 2010-2014, with at least one author @ TU Delft.

### Your (real) Impact Factor

$$\text{Impact Factor (corrected)} = \frac{
 \begin{array}{l}
 \# \text{ times your work is cited} \\
 - \# \text{ citations that actually trash your work} \\
 - \# \text{ times you cited yourself (nice try)} \\
 - \# \text{ times you were cited just to pad the introduction section} \\
 - \# \text{ citations the editor pressured the author to include to increase the journal's impact factor}
 \end{array}
 }{
 \begin{array}{l}
 \# \text{ original articles you've written} \\
 + \# \text{ articles you were included in out of pity or politics} \\
 + \# \text{ not-so-original articles you've} \\
 \text{ ~~written~~ copied and pasted}
 \end{array}
 }$$

## Journal

- *js* -- journal citation score = the average citation score of publications in a journal

## Paper

- *refs* -- number of references of the paper
- *authors* -- number of authors of the paper

## Authors

- *pMax* -- max(*p* of all authors of the paper)
  - *p* - number of publications (in Web of Science) of each author of the paper
- *mcsMax* -- max (*mcs* of all authors of the paper)
  - *mcs* -- average citation score of an author, average of all citations of all publications
- *pptopMax* -- max(*pp\_top\_10\_prop* of all authors of the paper)
  - *pp\_top\_10\_prop* -- percentage of author's publications in top 10% of their field
- *ageMax* -- max (academic age of all authors of the paper)
  - academic age - the difference between the publication year of the paper and the publication year of the first paper of the author

# bnlearn - an R package for Bayesian network learning and inference

- [Home Page](#)

- [Bayesian Network Repository](#)

- [About the Author](#)

[data & R code](#)

**bnlearn** is an R package for learning the graphical structure of Bayesian networks, estimate their parameters and perform some useful inference. It was first released in 2007, it has been under continuous development [for more than 10 years](#) (and still going strong). To get started and install the latest development snapshot type

```
install.packages("https://www.bnlearn.com/releases/bnlearn_latest.tar.gz", repos = NULL, type = "source")
```

in your R console. (More detailed installation instructions below.)

**bnlearn** implements the following *constraint-based structure learning algorithms*:

- PC (the *stable* version);
- Grow-Shrink (GS);
- Incremental Association Markov Blanket (IAMB);
- Fast Incremental Association (Fast-IAMB);
- Interleaved Incremental Association (Inter-IAMB);
- Incremental Association with FDR Correction (IAMB-FDR);
- Max-Min Parents & Children (MMPC);
- Semi-Interleaved Hiton-PC (SI-HITON-PC);
- Hybrid Parent

### Uninet standalone

**Uninet** is a standalone uncertainty analysis software package. Its main focus is dependence modelling for high dimensional distributions. Random variables can be coupled using Bayesian networks, **vine-copula constructions** or dependence trees.

Read the *Uninet help file* describing the software in detail: [UninetHelp.pdf](#) (1.4 MB)

Visit the [licensing page](#) for details about the Uninet and UninetEngine licences and to find out how to acquire the latest versions.

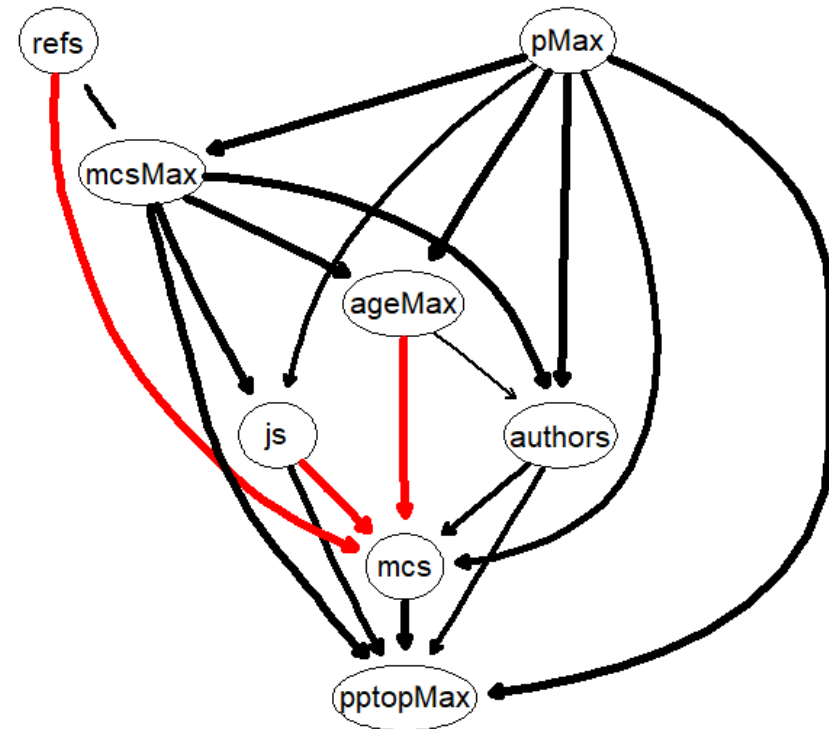

Max min hill-climbing hybrid algorithm, which combines local learning, constrained-based and search-and-score techniques

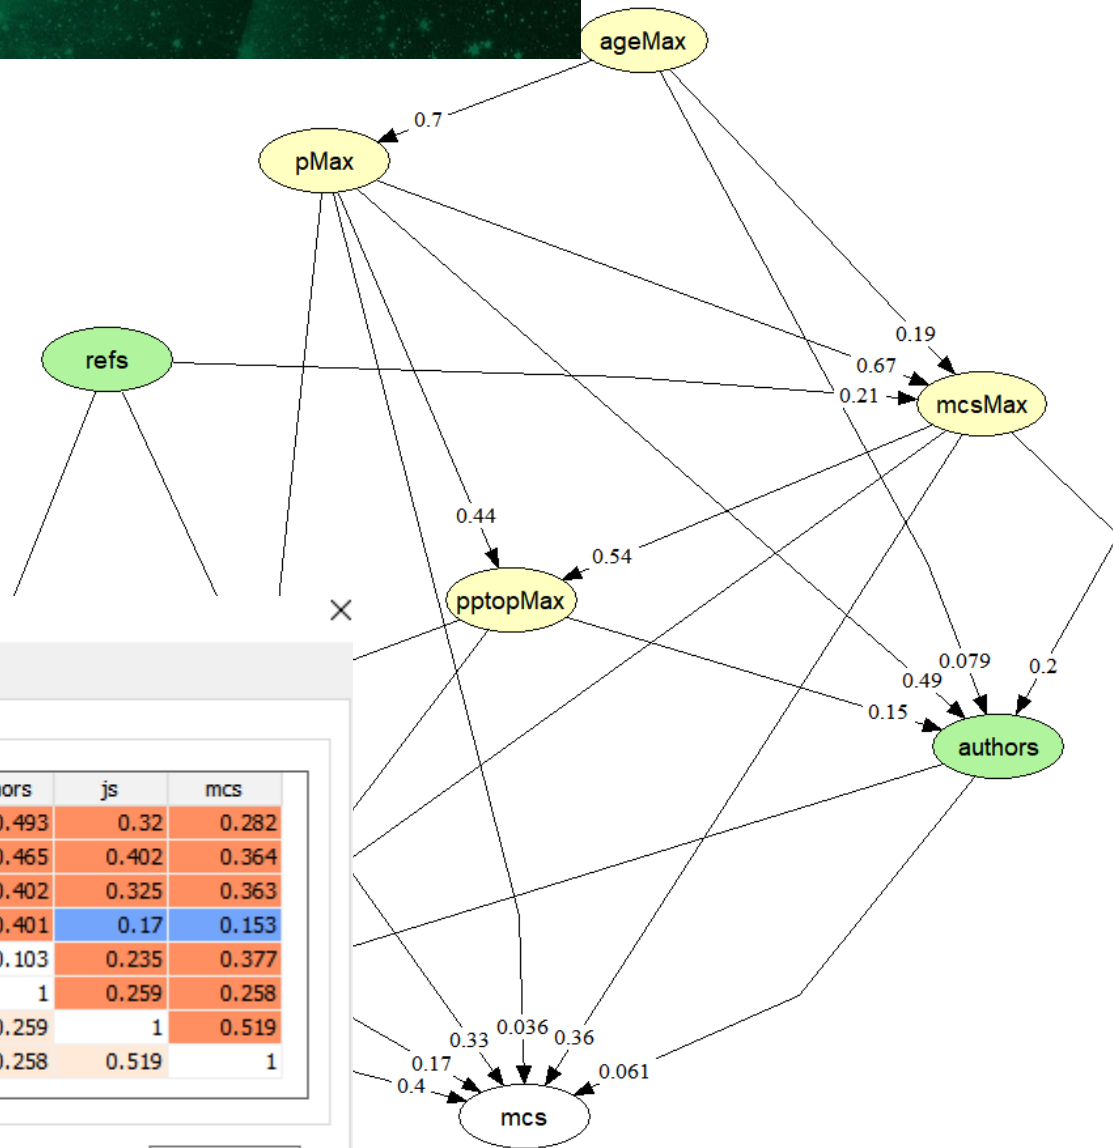

# robust

The robustness of the BN structure

- bootstrapped the data 200 times
- BN structures are obtained for each of the bootstrap sample
- strength of each arc is measured by the empirical frequency of that arc over the set of all BNs obtained from each bootstrap sample

## Correlation Matrices

## Welcome to CWTS Journal Indicators

CWTS Journal Indicators provides free access to bibliometric indicators on scientific journals. The indicators have been calculated by Leiden University's Centre for Science and Technology Studies (CWTS) based on the Scopus bibliographic database produced by Elsevier. Indicators are available for over 20,000 journals indexed in the Scopus database.

Indicators

Methodology

Services

### SNIP indicator

A key indicator offered by CWTS Journal Indicators is the SNIP indicator, where SNIP stands for *source normalized impact per paper*. This indicator measures the average citation impact of the publications of a journal. Unlike the well-known journal impact factor, SNIP corrects for differences in citation practices between scientific fields, thereby allowing for more accurate between-field comparisons of citation impact. CWTS Journal Indicators also provides stability intervals that indicate the reliability of the SNIP value of a journal. More information on the indicators offered by CWTS Journal Indicators is available on the [Methodology](#) page.

### Most recent update

The most recent update of the indicators offered by CWTS Journal Indicators took place in June 2022.

Year	F	SNIP	SNIP	% diff (2)
1995	43	15.30	4.23	0.28
2000	42	18.19	10.87	1.04
2005	39	22.33	18.97	0.48
2010	39	28.53	12.89	0.26
2015	32	26.46	14.69	0.19
2016	32	34.34	17.44	1.26
2017	34	42.64	19.92	1.74
2018	33	33.83	23.59	0.24
2019	35	40.95	27.84	0.34
2020	34	39.44	31.83	0.44
2021	38	33.16	32.77	0.44
2022	43	33.68	32.82	0.44
2023	46	38.10	41.08	0.24

All variables were discretized into 4 states using Hareminck's Algorithm [1]
